Introduction

User Aspect

Literature Survey

Architecture Of Proposed System

UML Diagrams

Software Requirements

Application

- The proposed system contains the Sentiment analysis on Social Media Data.
- Comments are taken from the user and sentiment analysis done.
- For the comments polarity is given i.e. positive, negative and neutral.
- By using sentiment analysis of review we come to know whether the user is satisfied or not.

Thumbs Up or Thumbs Down? Semantic Orientation Applied to Unsupervised Classification of Reviews

- predicts review by the average semantic orientation of a phrase that contains adjective and adverb thus calculating whether the phrase is positive or negative with the use of unsupervised learning algorithm which classifies it as thumbs up or thumbs down review

Product Review Information Extraction Based on Adjective Opinion Words

- uses a comparison between positive and negative sentences. It extracts information from the Web and manually label the word set which requires a lot of unnecessary effort.

Sentiment Classification of Review Documents using Phrase Patterns

- applied phrase pattern method for sentiment classification. It uses part of speech based rules and dependency relation for extracting contextual and syntactic information from the document.

SentiFul: A Lexicon for Sentiment Analysis

- generates a sentiment lexicon called SentiFul which uses and enlarges it through synonyms, antonyms. These methods assign sentiment polarity which helps in expanding the lexicon to improve the sentiment analysis.
